Cct Diagram Of A36 Steel

ASTM A36 is the most commonly used mild and hot-rolled steel. It has excellent welding properties and is suitable for grinding, punching, tapping, drilling and machining processes. Yield strength of ASTM A36 is less than that of cold roll C1018, thus enabling ASTM A36 to bend more readily than C1018.

CCT diagram of A36 steel showing the cooling curves obtained by measuring temperatures by the thermocouples for the (a) ALW and (b) LWACW. As it can be seen in the CCT diagram, there are several critical temperatures (A C1 , A C3 and M s) which are used to anticipate the microstructure based on the cooling rate.

A continuous cooling transformation (CCT) phase diagram is often used when heat treating steel. These diagrams are used to represent which types of phase changes will occur in a material as it is cooled at different rates. These diagrams are often more useful than time-temperature-transformation diagrams because it is more convenient to cool materials at a certain rate (temperature-variable ...

These diagrams allow the prediction of hardness and microstructure in the center of any diameter bar. This is also the most common method for displaying CCT diagrams. Figure 1: CCT diagram for AISI 1060 steel. Figure 2: CCT diagram for AISI 5160 steel. As can be seen in the diagrams, the AISI 5160 steel has a greater hardenability (Figure 2).

With these various graphs, predictions can be made as to what the microstructure of the steel will look like. CCT diagrams are more applicable to quenched steels - if the cooling rate is faster than the critical cooling rate, then martensite is expected to form. More details can be found in the report.
